

## : e2i – Estimate to Invoice

Everything you need to manage a sheet metal production environment

e2i is production management for sheet metal environments. Incorporating all of the power of eQuote and adding order management, shop floor routings, stock control, purchasing and everything else you will need right up to producing the invoice and transferring it to your accounts system.

### Multipurpose management

Built on a robust industry standard Microsoft SQL database, e2i encompasses the processes faced by all manufacturing companies, enabling the tracking and management of cost throughout the design and manufacture process with the added benefit of being integrated into Radan CAD/CAM. Developed to meet the needs of sheet metal subcontractors but equally at home in any production environment.

### Standard components

A typical e2i system comprises a standard server core. The only option for this is stock control. Standard components within the core in addition to those provided by eQuote are Sales Orders, Route Cards, Nest Routes, Purchasing, Capacity Planning, Deliveries and Invoicing, where a system has stock control enabled. All e2i clients have access to all core components at all times.

Shop Floor Data Capture (SFDC) can be used to close the loop back to the original time estimates, allowing comparisons of actual times to estimated and to track components through the production process.

### Keeping things simple

When paired with a supported accounts system, data is easily transferred, avoiding manual errors.

### Features include

Unique links to Radan CAD/CAM

Advanced functionality for nesting operations

User level security

Simplified stores module

Capacity planning

Flexible stock control

Accounting links

Assembly and BOM management

All records easily retrievable
